INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Ashvitha I

Role: Data Collection and Data Quality
Project Title: Flight Delay Analysis and Visualization

WEEK 6 – Organizing Relevant Data for Analysis

During the sixth week, I focused on reviewing the data required for further analysis and ensuring that the relevant information was available to the team. The project had moved towards feature preparation and statistical analysis, making it important to verify the availability and consistency of the selected variables.

I examined the flight-related columns that were important for studying departure delays, arrival delays, and airline performance. I also considered how categorical and numerical variables could be used differently during analysis.

I coordinated with Annalakshmi to understand the features being prepared and checked whether the required source columns were available in the dataset. I also communicated with Dharshini to

understand which variables were useful for creating visual comparisons.

Another part of my work involved reviewing the dataset's organization and ensuring that the information required for different stages of the project was accessible. I understood that a well-organized dataset could reduce unnecessary complications during analysis and dashboard development.

I also helped maintain consistency in the dataset information shared with the documentation team.

Outcome and Learning:

This week helped me understand the importance of data organization and feature availability. I learned how the initial collection and quality assessment stages influence the later stages of a data science project.
