INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Dharshini P

Role: Exploratory Data Analysis and Data Visualization
Project Title: Flight Delay Analysis and Visualization

WEEK 5 – Visualization of Flight Delay Patterns

During the fifth week, I concentrated on examining flight delay patterns through suitable visual representations. After the initial exploration of the dataset, I focused on identifying which charts could communicate the findings more effectively.

I explored the use of bar charts for comparing delay-related information across different categories, such as airlines and airports. These visualizations could help users understand differences between groups without having to examine large tables of numerical values.

I also considered the use of histograms to study the distribution of departure and arrival delays. By examining the shape of a distribution, it becomes easier to understand whether most flights

experience small delays or whether a smaller number of flights experience unusually large delays.

In addition, I explored the importance of using appropriate labels, titles, and scales. A chart should not only display information but also make its meaning clear to the viewer.

I coordinated with the team to review the findings obtained from EDA and identify the visual elements that would be useful for the project report and dashboard.

Outcome and Learning:

This week improved my ability to select suitable charts for different types of analysis. I also learned that effective visualization requires clarity, accuracy, and proper presentation of information.
