INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Joshna Amirthaa Mariappan

Role: Documentation and Presentation
Project Title: Flight Delay Analysis and Visualization

WEEK 5 – Progress Review and Report Development

During the fifth week, I focused on reviewing the project's progress and updating the documentation according to the activities completed by the team. By this stage, the project had progressed through dataset understanding, preprocessing, and exploratory analysis. Therefore, it was important to organize the information collected so far into a consistent report.

I reviewed the previously prepared sections, including the introduction, problem statement, objectives, project scope, dataset overview, preprocessing, and EDA. I checked whether the information was arranged in a logical order and whether the descriptions were relevant to the actual project work.

I also coordinated with my teammates to collect updates regarding their individual tasks. This helped me understand which activities had been completed and which stages required further attention. Based on these updates, I organized the project progress and identified the sections that needed to be expanded or revised.

Another important responsibility was maintaining consistency in technical terms and project descriptions. For example, I ensured that terms such as data preprocessing, exploratory data analysis, correlation analysis, and visualization were used appropriately throughout the documentation.

I also started planning how the project findings could be presented in the final presentation. I considered the sequence of slides required to explain the project, beginning with the introduction and ending with the findings and conclusion.

Outcome and Learning:

This week helped me improve my report-writing and organizational skills. I understood that documentation is not a one-time activity but an ongoing process that must be updated as the project develops.
