INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Dharshini P

Role: Exploratory Data Analysis and Data Visualization

Project Title: Flight Delay Analysis and Visualization

WEEK 4 – Exploratory Data Analysis and Initial Visual Exploration

During the fourth week, I focused on exploratory data analysis and began examining how flight delay information could be understood through visual representations. EDA was an important stage because it helped reveal patterns and trends within the dataset.

I explored the important numerical variables related to departure and arrival delays. I considered how their distributions could be represented using histograms and box plots. These visualizations can help understand the spread of values, identify unusually high observations, and examine the overall characteristics of the data.

I also considered comparisons between different airlines and airports. Such comparisons could help identify differences in the distribution of flight delays across categories.

Another important part of my work involved understanding the relationship between departure delay and arrival delay. I explored the usefulness of scatter plots for representing how changes in one variable relate to changes in another.

I coordinated with Annalakshmi to understand the EDA findings and ensured that the visualizations being planned were relevant to the actual data.

Outcome and Learning:

This week helped me gain practical knowledge of exploratory data visualization. I learned how different charts can be selected based on the type of data and the analytical question being investigated.
