INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Joshna Amirthaa Mariappan

Role: Documentation and Presentation
Project Title: Flight Delay Analysis and Visualization

WEEK 4 – Documentation of Exploratory Data Analysis

During the fourth week, I concentrated on documenting the Exploratory Data Analysis (EDA) performed by the team. EDA was an important stage of our project because it helped us understand the dataset and identify meaningful patterns before moving towards advanced statistical analysis.

I coordinated with the team members working on EDA to understand the variables they examined and the observations obtained from the analysis. I focused on organizing the findings related to flight delays, particularly departure delays and arrival delays. I also familiarized myself with how different visual representations could help explain the characteristics of the dataset.

As part of my work, I prepared the structure for the EDA section of the project report. This included documenting the purpose of exploratory analysis, the variables considered, and the importance of examining patterns within the data.

I also reviewed the visualizations and analytical observations shared by the team. I understood that graphs and charts were useful for identifying trends that might not be immediately visible from raw numerical data. I organized the findings so that they could later be incorporated into the final presentation.

In addition, I began preparing short explanations for the important observations. My aim was to ensure that the project documentation did not contain only graphs and numerical results but also explained what those results represented.

Outcome and Learning:

This week improved my understanding of exploratory data analysis and its role in a data science project. I learned how to convert analytical findings into structured explanations suitable for reports and presentations.
