# INDIVIDUAL WEEKLY PROJECT REPORTS

**Student: Annalakshmi R**

## Role: Data Preprocessing and Exploratory Data Analysis (EDA)

## Project Title: Flight Delay Analysis and Visualization

---

### WEEK 1 – Project Introduction and Planning

During the first week, I participated in the initial discussions regarding the selection and planning of our project, Flight Delay Analysis and Visualization. I familiarized myself with the main objective of the project, which was to study flight-related data and identify meaningful patterns and trends in flight delays. We discussed how data science techniques could be used to understand airline operations and examine the factors associated with delays.

My primary focus was understanding the data preprocessing and exploratory data analysis stages, as these were my assigned responsibilities. I explored the general requirements of the project and understood that the dataset would need to be examined and cleaned before meaningful analysis could be performed.

I also discussed with my teammates the different stages involved in the project, including data collection, data quality assessment, data cleaning, EDA, statistical analysis, and visualization. We divided the responsibilities among the team members to ensure that each stage received proper attention.

I began familiarizing myself with the types of variables that might be useful for studying flight delays, such as departure delay, arrival delay, airline information, and airport details.

**Outcome and Learning:**

This week helped me understand the overall project workflow and the importance of data preprocessing before performing any analysis. I also gained a basic understanding of my responsibilities in the project.
