INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Ashvitha I

Role: Data Collection and Data Quality
Project Title: Flight Delay Analysis and Visualization

WEEK 1 – Project Planning and Dataset Identification

During the first week, I participated in the initial project planning and discussions regarding our selected topic, Flight Delay Analysis and Visualization. I understood that the project aimed to study flight-related information and identify patterns associated with departure and arrival delays.

My primary responsibility was data collection and data quality assessment. Therefore, I focused on identifying a suitable dataset that contained sufficient information for analyzing flight delays. I explored the type of data required for the project and understood the importance of selecting a dataset with relevant flight details, airline information, airport information, and delay-related variables.

I also discussed the project requirements with my teammates and understood how the dataset would be used throughout the project. We considered the importance of having sufficient records and relevant attributes to support exploratory data analysis and statistical techniques.

I began exploring possible sources of flight-related data and understood that publicly available datasets could provide historical information useful for identifying trends.

Outcome and Learning:

This week helped me understand the importance of selecting an appropriate dataset for a data science project. I also learned how data availability and relevance influence the direction of the analysis.
