INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Dharshini P

Role: Exploratory Data Analysis and Data Visualization
Project Title: Flight Delay Analysis and Visualization

WEEK 1 – Project Planning and Visualization Requirements

During the first week, I participated in the initial discussions regarding our project, Flight Delay Analysis and Visualization. I understood that the project aimed to study flight-related information and identify patterns in departure and arrival delays using data analysis techniques.

My primary responsibility was exploratory data analysis and visualization. Therefore, I focused on understanding how the information in the dataset could be represented through graphs, charts, and other visual methods.

I explored the general purpose of data visualization and understood how it could help communicate complex information in a simple and meaningful manner. I also considered the types of visualizations that might be useful for our project, such as bar

charts, line graphs, histograms, and other comparison-based representations.

I discussed the project requirements with my teammates and understood how my work would connect with data preprocessing and statistical analysis. I also familiarized myself with the overall workflow so that the visualizations could be planned according to the project's objectives.

Outcome and Learning:

This week helped me understand the importance of visualization in data analysis. I learned that suitable visual representations can make patterns and relationships easier to identify and communicate.
