# INDIVIDUAL WEEKLY PROJECT REPORTS

**Student: Joshna Amirthaa Mariappan**

## Role: Documentation and Presentation
## Project Title: Flight Delay Analysis and Visualization

---

### WEEK 1 – Project Introduction, Planning and Documentation

During the first week of the project, I focused on understanding my project topic, its objectives, and the overall workflow. Our team selected Flight Delay Analysis and Visualization as our project with the aim of studying flight-related information and identifying patterns and trends in flight delays. I participated in the initial discussions with my teammates to understand the problem area and determine how DSV techniques could be used to explore it.

My primary responsibility was to organize and document the information discussed during the project planning stage. I worked on understanding the project scope, which included data collection, data preprocessing, exploratory data analysis, statistical

analysis, visualization, and dashboard development. I also helped structure the initial documentation by identifying the important sections that would be required in the final project report.

I explored the general background of the aviation industry and understood how flight-related data could provide useful information about airline operations. I also familiarized myself with the importance of studying departure delays, arrival delays, airline performance, and airport-related information.

Another important task during this week was coordinating with the team to understand each member's responsibilities. We divided the work based on individual roles so that the project could progress systematically. I noted the planned activities and organized them into a preliminary project workflow.

**Outcome and Learning:**

By the end of the first week, I had developed a basic understanding of the project and its objectives. I also established the initial structure for the project documentation and understood the importance of maintaining clear records of every stage of the project.
