GROUP WEEKLY REPORTS

Project Title: Why 2024 Flights Ran Late
Team: Team 10 – DATA-VIZ HACK-A-BIT
Team Members: Annalakshmi R, Ashvitha I, Dharshini P, Joshna Amirthaa Mariappan

---

WEEK 1 – PROJECT INTRODUCTION AND PLANNING

During the first week, our team focused on understanding the project requirements and establishing a clear direction for our work. We discussed various possibilities related to data science and visualization before finalizing our project topic, "Why 2024 Flights Ran Late." The project aims to analyze flight delay data and identify the factors that contribute to delays in airline operations.

We began by understanding the importance of analyzing flight delays in the aviation industry. Flight delays can affect passengers, airline companies, airport operations, and overall transportation efficiency. Therefore, analyzing historical flight data can help us discover patterns and understand the reasons behind delays.

After selecting the topic, we discussed the problem statement, project objectives, and expected outcomes. We decided to work with a large dataset containing information about flight schedules, departure delays, arrival delays, airlines, airports, and other relevant attributes.

The team also planned the overall workflow of the project, including data collection, data quality assessment, data cleaning, exploratory data analysis, outlier detection, feature engineering, dimensionality reduction, and visualization.

Responsibilities were distributed among all team members based on their interests and areas of contribution. We also discussed the tools and technologies required for implementation, such as Python, Pandas, NumPy, Matplotlib, Seaborn, and Scikit-learn.

By the end of the first week, we had established a common understanding of the project objectives, identified the initial requirements, and prepared a basic plan for proceeding with the subsequent stages of development.
