INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Ashvitha I

Role: Data Collection and Data Quality
Project Title: Flight Delay Analysis and Visualization

WEEK 2 – Data Collection and Initial Dataset Inspection

During the second week, I focused on collecting the dataset required for our project. After exploring available sources, our team selected a flight delay dataset from Kaggle. I examined the dataset source and familiarized myself with the information provided along with it.

I worked on understanding the dataset's basic structure, including its file format, columns, records, and general organization. The dataset contained flight-related information that could be used to study airline operations and delay patterns.

I also examined the different categories of attributes available in the dataset. These included airline details, airport-related information, scheduled and actual timings, and numerical variables associated with flight delays.

An important part of my work was checking whether the collected dataset was suitable for the project objectives. I considered whether the available variables would support the planned analysis and whether the dataset contained sufficient information for visualization.

I communicated the dataset details to the other team members so that they could begin understanding the data and planning their respective tasks.

Outcome and Learning:

By the end of this week, the team had identified the dataset to be used for the project. I learned how to locate, inspect, and evaluate publicly available datasets for analytical purposes.
