INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Dharshini P

Role: Exploratory Data Analysis and Data Visualization

Project Title: Flight Delay Analysis and Visualization

WEEK 2 – Dataset Exploration and Identification of Visual Variables

During the second week, I focused on understanding the dataset and identifying the variables that could be used for exploratory analysis and visualization. I examined the available flight-related information and explored how different attributes could be represented visually.

I paid attention to numerical variables such as departure delay, arrival delay, and elapsed time. I also examined categorical variables such as airline information and airport details, which could be useful for comparisons.

I considered how different visualizations could be used depending on the type of variable being studied. For example, bar charts could help compare categories, histograms could show the

distribution of numerical values, and scatter plots could help examine relationships between two numerical variables.

I also coordinated with Ashvitha to understand the dataset structure and with Annalakshmi to understand the preprocessing activities that would be performed before detailed analysis.

During this stage, I began planning the visual analysis required for the project and identified the important questions that the charts should help answer.

Outcome and Learning:

By the end of this week, I had developed a clearer understanding of the dataset and the different visual techniques that could be used to explore flight delay patterns.
