INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Joshna Amirthaa Mariappan

Role: Documentation and Presentation
Project Title: Flight Delay Analysis and Visualization

WEEK 2 – Dataset Understanding and Documentation

During the second week, my main focus was understanding and documenting the dataset selected for the flight delay analysis project. Our team worked with a flight dataset obtained from Kaggle which dated from 2018-2024. I examined the available dataset information and familiarized myself with its structure, features, and purpose.

As part of my documentation responsibility, I focused on recording the dataset source and organizing the information required for the project report. I explored the different attributes available in the dataset, including flight-related details, departure information, arrival information, and delay-related variables. Understanding these attributes was important because they

formed the foundation for the analysis that would be performed in the upcoming weeks.

I also worked on preparing the Dataset Overview section of the project documentation. This involved organizing details such as the dataset format, its purpose, and the types of information it contained. I understood that a proper dataset description was necessary to explain where the project data came from and how it would be used.

In addition, I coordinated with the team members responsible for data collection and data quality to obtain the relevant information about the dataset. I made sure that the documentation reflected the data being used by the team rather than relying on general information about flight delays.

I also began organizing the report into sections such as Introduction, Problem Statement, Objectives, Project Scope, Dataset Description, and Methodology.

Outcome and Learning:

This week helped me understand the importance of dataset documentation in a data science project. I learned how to describe a dataset clearly and explain the relevance of its attributes to the overall project objective.
