INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Annalakshmi R

Role: Data Preprocessing and Exploratory Data Analysis (EDA)
Project Title: Flight Delay Analysis and Visualization

WEEK 8 – Reviewing Analysis and Supporting Dashboard Development

During the eighth week, I focused on reviewing the results obtained from data preprocessing and exploratory analysis. I worked with the team to ensure that the findings were consistent and suitable for presentation through the project dashboard.

I reviewed the important variables used in the analysis and examined whether the conclusions drawn from the data were supported by the observations. I also considered how the findings could be represented through charts and graphs.

Since the dashboard was intended to communicate the results clearly, I coordinated with Dharshini to understand the visualizations being prepared. I helped review whether the

selected information accurately represented the patterns identified during EDA.

Another important task was checking the consistency between the cleaned dataset and the information used for visualization. I understood that using incorrect or outdated data during dashboard development could lead to misleading conclusions.

I also revisited the preprocessing and EDA stages to identify any observations that needed clarification before the final presentation.

Outcome and Learning:

This week helped me understand the importance of validating analytical findings before presenting them. I also learned how data preprocessing and EDA contribute directly to the development of an effective dashboard.
