INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Ashvitha I

Role: Data Collection and Data Quality
Project Title: Flight Delay Analysis and Visualization

WEEK 8 – Dashboard Data Verification and Quality Review

During the eighth week, I focused on reviewing the data used for dashboard development. Since the dashboard was intended to present the project's important findings, it was necessary to ensure that the information displayed was consistent with the dataset and the analysis.

I coordinated with the visualization team to understand the charts and information being included in the dashboard. I reviewed the relevance of the variables used for representing flight delays and considered whether the information was consistent with the results obtained during analysis.

I also helped check the numerical values and categories being used in the visual representations. This was important because

incorrect data or inconsistent filtering could affect the interpretation of the dashboard.

Another part of my work involved communicating with the documentation team to ensure that the dataset details and findings used in the report matched the information presented through the dashboard.

I understood that data quality assessment continued even during the final presentation stage because the accuracy of the dashboard depended on the quality of the underlying data.

Outcome and Learning:

This week helped me understand the relationship between data quality and data visualization. I learned that validating the information before presenting it is important for maintaining the reliability of project findings.
