INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Dharshini P

Role: Exploratory Data Analysis and Data Visualization
Project Title: Flight Delay Analysis and Visualization

WEEK 8 – Dashboard Design and Visualization Development

During the eighth week, I focused on organizing and developing the visual components required for the project dashboard. The dashboard was intended to present the major findings of the flight delay analysis in an interactive and understandable format.

I worked on identifying the most important information that needed to be displayed. This included delay-related variables, comparisons between categories, and other relevant findings obtained during exploratory data analysis.

I considered how different charts could be arranged to make the dashboard easy to navigate. I understood that a dashboard should present important information in a structured manner rather than displaying too many unrelated visualizations.

I also focused on the clarity of the visual elements. Titles, labels, legends, and appropriate scales were important for helping users understand what each chart represented. I reviewed the visualizations to ensure that they were relevant to the project's objectives.

Another part of my work involved coordinating with Joshna, who was preparing the documentation and presentation. I shared the visualization details so that the dashboard could be explained accurately in the report and slides.

Outcome and Learning:

This week helped me develop a better understanding of dashboard design and visual communication. I learned how to organize multiple visualizations into a single interface while maintaining clarity and consistency.
