INDIVIDUAL WEEKLY PROJECT REPORTS

Student: Joshna Amirthaa Mariappan

Role: Documentation and Presentation

Project Title: Flight Delay Analysis and Visualization

WEEK 8 – Dashboard Documentation and Presentation Preparation

During the eighth week, I focused on preparing the documentation and presentation materials for the project dashboard. The dashboard was an important part of our project because it provided a visual and interactive way to communicate the findings obtained through data analysis.

I coordinated with the team members working on visualization to understand the dashboard components, charts, and important information being presented. I reviewed the available visual elements and organized the explanations required to describe their purpose in the presentation.

My documentation work included preparing the Dashboard section of the report. I focused on explaining how the dashboard brought together the major findings of the project and allowed users to understand flight delay patterns through visual representations.

I also worked on structuring the PowerPoint presentation. I organized the slides in a logical sequence, beginning with the project introduction, problem statement, objectives, and scope. The presentation then moved towards the dataset, preprocessing, exploratory data analysis, statistical techniques, findings, and dashboard.

Another important task was ensuring that the presentation contained concise explanations rather than lengthy paragraphs. I focused on making the slides clear and readable while retaining the important technical information.

I also reviewed the consistency of the presentation and report, especially the dataset details, numerical findings, terminology, and project workflow. This helped ensure that both documents communicated the same information.

Outcome and Learning:

This week improved my presentation planning and information-organizing skills. I understood how effective documentation and visual communication help explain a technical project to an audience.
